CHALMERS	Anonymous code Anonym kod <b>D027 - SFG</b>	Points for question (to be filled in by teacher) Poäng på uppgiften (ifyller av lärare)	Consecutive page no. Löpande sid nr Question no. Uppgift nr <b>1</b>
----------	---	--	--

Q 1.1: when we use join we combine table together

A) in inner join ~~X~~ we combine ~~two~~ tables but removes Null information in both tables?

B) in full outer join ~~X~~ we don't remove tuples (information) so in queries we can find them but shows in final table with "Null" statement

ID	grade uni	t-ID	degree uni
1	4	3	BSc
2	3	2	PhD
3	null	1	Null

Student

t-ID	degree uni
3	BSc
2	PhD
1	Null

8 example  
teacher

if we use full outer join for query on the final result table (combination student and teacher table by join) we can see the information degree teacher.id = 1 and also grade of Student - id = 3 with Null

but in inner join it removes that information in final result table.

!

inner join returns only rows with matching condition even if the other attributes are null

CHALMERS	Anonymous code	Points for question (to be filled in by teacher)	Consecutive page no. Löpande sid nr
	Anonym kod 2027 - SF G	Poäng på uppgiften (ifylls av lärare)	Question no. Uppgift nr <u>1</u>

9.1.2) ~~INSTRUCTORS course is not primary key~~

IDEAS: INSTRUCTOR. CourseTitle is also in COURSE entity

as we know one of the best database design is to Reduce Functional dependency ~~and redundancy~~.

redundancy of

to remove duplicate information and reduce database storage

We can find CourseTitle with foreign key (courseID) in INSTRUCTORS. We don't need to

better design: Course (courseID, Title, Department)

iii) s

INSTRUCTOR (InstructorID, office, courseID)

CourseID → COURSE · CourseID

ii)

it violate NF2 + NF3

because every ~~relation~~ <sup>Attribut</sup> should have exact one relation with PK and not have it in different table  
example

$\{ \quad X \rightarrow B \}$

$X \rightarrow A \quad A \rightarrow B$  so it is redundant because store duplicate information

Q 1.3) Indices is a ~~data~~ structure that help to find information in database ~~more faster~~ without full scanning. It is like a book indices that helps to find our specific information from it.

(Solve full Scanning Problem)

It added to parts of database and instead of search all database we searching just performs in a more straight and smaller part.

advantages → faster finding our information that Search for  
query optimization

disadvantages → Store more space in database

Q 1.4) ①

volume ( big data has big database with different information that make hard to query and search on it or process )

~~Volume~~

what  
do  
mean?

② veriaty

~~Veriaty~~

③ Velocity /

④

⑤

Solution:

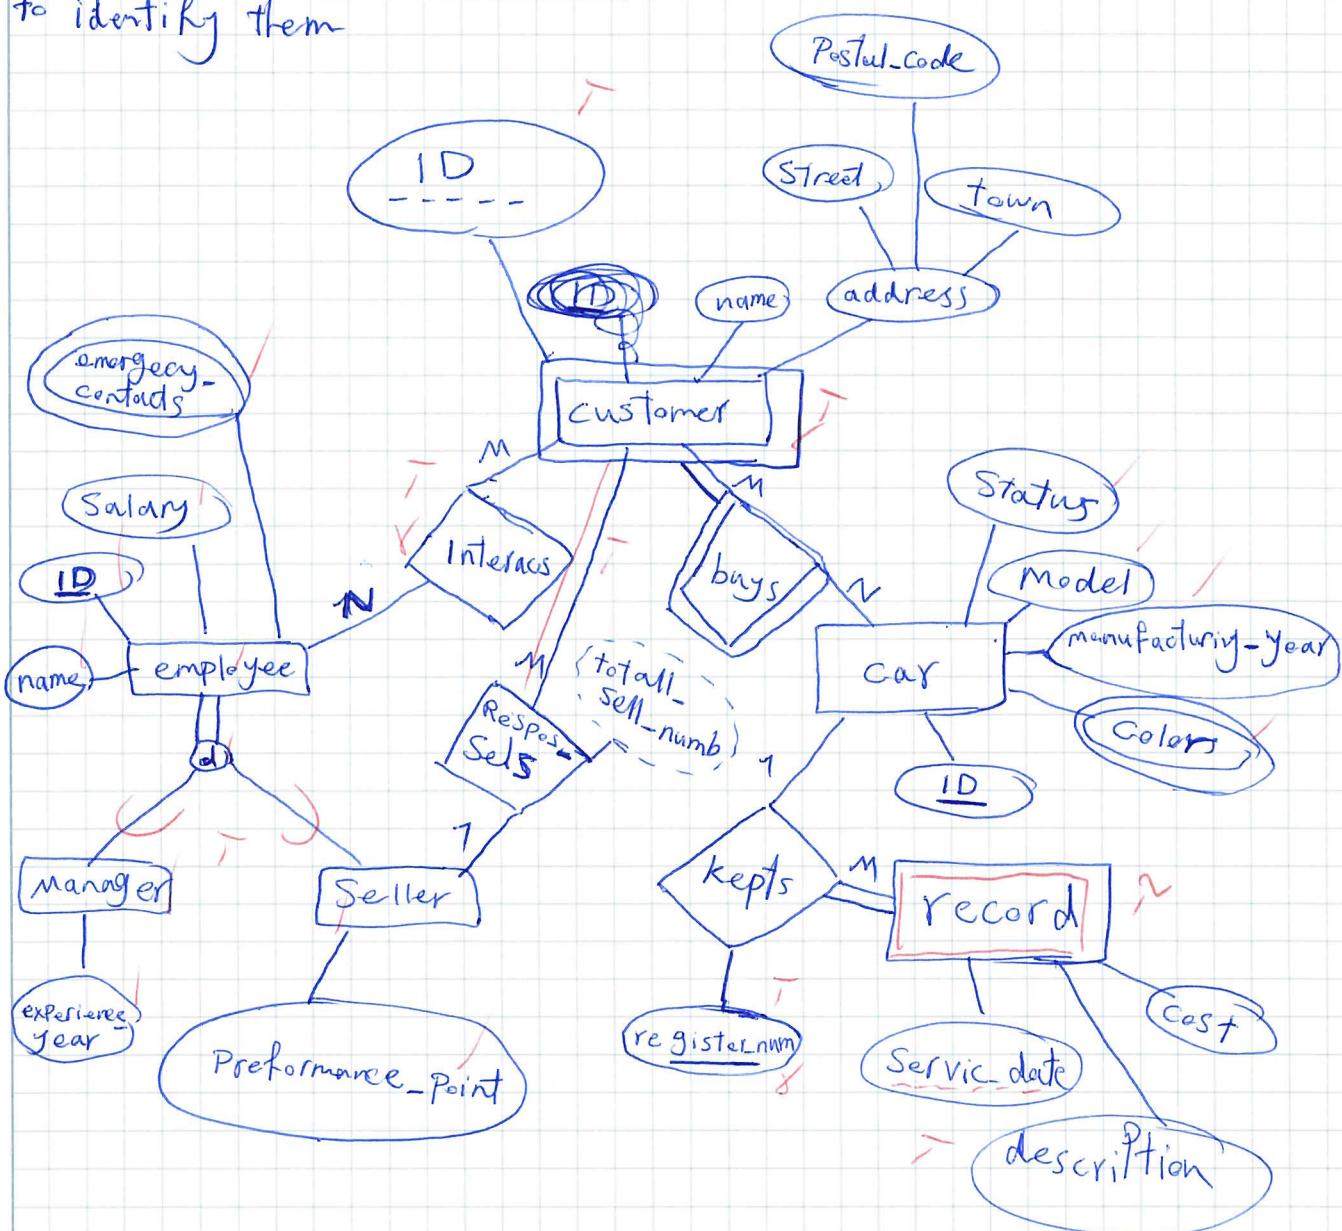

① Volume → Sharding → with sharding we can divided big data to smaller parts and process them separately or also parallel and if one part face problem other parts can continue to work.

② I forgot terms of this V keyword but it is about consistency and integrity \*

2

- \* address can have combination to be more accurate  
Attributing
- \* Car need a unique ID for identifying
- \* consumer also can have a ID but ~~also need~~ it is weak entity and need register by buy a car (car is Strong entity)
- \* we can use ~~ID~~ unique id for record but can use ~~car~~ ID of car that we added  
(Records cannot be exists without car)  
it is better to ID For Employee be unique as PK to identify them
